ABSTRACT OF THE DISCLOSURE

A multilength tubular transporter is provided, comprising a base frame, including at least two main beams, wherein the main beams are connected by a plurality of cross members, a floor substantially covering the areas defined by the main beams and cross members; a plurality of substantially vertical guide members connected to each of the main beams; a lifting arrangement operatively connected to the base frame for enabling the transporter to be lifted to and from a vehicle; a stacking device operatively connected to the base frame for engaging the guide members of a second transporter, wherein the transporters may be securely stacked; and wherein the base frame includes one or more winches for securing tubulars within the transporter.
